1. Calibration

Is S unit-variance where nothing changed?

✓ Answered: Yes

Robust $S/(1.4826 \cdot \mathrm{MAD})$ normalisation on DR1 co-adds.

2. Morphology

Can dipoles be told from monopoles at $3''$?

✓ Answered: Yes

Physical kinematic separation $\leq \mu_{\max}\Delta t$ and $\leq 2\times$ lobe ratio.

3. Identity

What fraction is in existing catalogues?

✓ Answered: 91%

99 of 109 detections explained by Gaia, AllWISE, VSX, or artefacts.

4. Completeness

What did we miss, and is it measured?

✓ Answered: 69.3%

Measured across 12,240 strict injections on 18 DR1 fields.

Explicit scope boundaries, stated up front rather than discovered by a reviewer:

- Sub-pixel crowded-field PSF photometry in the Galactic Centre (Sgr A* is intentionally refused)
- Unfiltered streaming alert distribution (SPHEREx*Lens* is an inspectable discovery portal, not a broker)
- Densely sampled short-cadence light curves on arbitrary fields (addressed specifically in Deep Fields §7)
- Absolute arcsecond astrometry below the $6.2''$ telescope PSF blur
